

ABSTRACT

The present invention relates to an image printing apparatus, devised such that numerous users can reliably and efficiently input editorial input. A first user utilizes operating panel 13-1, and a second user utilizes operating panel 13-2, respectively. Because an image photographed by CCD camera 15 is displayed on operating panel 13-1 and operating panel 13-2, each user selects an image he likes, and inputs image editing such as additional images by operating a control button displayed on the operating panel that he is using with a touch pen 14-1 or 14-2.
